									Comm	ents									

This traceability matrix shows the relationship between the requirements for Assessment 3 and the associated Black-Box tests or Unit tests. In addition, tests which did not implicitly test a specific requirement but were still necessary to test consistent game execution have also been omitted. This matrix shows that each of the requirements specified in the Assessment 3 brief have been tested by at least 1 test case and since all of these tests were successful, each requirement has been satisfied. Test highlighted in blue signify tests that have been added specifically to test additions made in Assessment 3 to meet the fulli product breif requirements. From the traceability matrix we can see that all requirements have at least 1 test case apart from requirement N1. However, this requirement has still been met by using the User manual which was not black-box or unit tested. We are therefore confident all requirements have been met.
